The records of all children and adolescents with Hodgkin lymphoma (HL) in the Netherlands diagnosed between 1975 and 1992 and treated in the 7 Dutch children's hospitals were reviewed. There were 63 patients with HL, with a mean age of 11 years at presentation. HL in children younger than 15 years at presentation is distinctly different from adult HL. Presentation was most frequently non-specific, with nodular sclerosing Hodgkin lymphoma being most common. Other disease syndromes were not frequently recognized. All patients were treated with standard therapy, that is, four or more courses of an ABVD regimen. Total irradiation was the treatment of choice for localized disease (40 patients), whilst mediastinal disease was treated with chemotherapy plus limited radiation (21 patients). The 5-year event-free survival was 77% for patients with localized and 37% for patients with mediastinal disease. The 5-year survival was 85% for all patients.
