A-PDF Deskew 3.5.4 Crack + Serial Number Download.Q: Programming with variables I have been doing a lot of thinking about programming lately and I came upon an issue I can't find an answer for, so I thought I'd put it out here: Is there any good reason to use a variable in a programming language, that is not known until runtime? To be more specific, is there any real reason to use something like `int noSoFar = 0;` or

---

float noSoFar = 0.0; in C/C++ or Java/Python instead of a "const" keyword? I think the answer is no, but then I always think about const and variables being one and the same, and then I see it being used to just store something into a variable. Obviously this is more of a theoretical question, just to get a better understanding. I think I would understand this the first time I needed to do it, but I don't like that it is often used as an "expedient" way of doing things and leads to errors, since not all variables should be initialized with constants. EDIT: To clarify, I'm asking if there is any use of using variables as constants? EDIT 2: Thanks to everyone who answered so far. Your answers helped me realize that I do use them for constant values, but I have been using them as variables to store "memory addresses" or something like that. A: Variables which are used as constants are called constants in C++ - the type isn't important: const float myVal = 1.0; Since (most) variables are pointers, they can be used as constant pointers as
