# Keil Mdk Arm 4.6 Full Download

## ##HOT##

the section on native api documentation covers the jssc library, a c/c++ library for applications requiring low-level control of the microcontroller. it is separated from the cortex-m core api which is covered in the previous section. the java api provides access to the i/o and peripherals of the microcontroller, as shown in figure 1-3. it consists of a number of class libraries and examples. the sdk also provides java apis for interacting with the system resources of the microcontroller using the java language. the atmel svd files have had quite a few changes that should be noted. some of the changes are listed below. added three new core modules, one for timer, one for serial peripheral interface and one for the real time clock. these new core modules are listed in the atdf and svd files but do not have a symbol in the iarik file as they are only core modules in the reference design. changed the description of tc1 and tc2 from instance nodes to macros in the appropriate header files. the macro names that represent the tc1 and tc2 modules have also changed. tc1 and tc2 should no longer be defined as macros in the header files. changed descriptions of interrupt controllers to match what is in the datasheet for the devices and removed the definition of interrupt controllers from the atmel svd file. these changes made it possible to get the svd file to build and the iar program will run without error. the interrupt controllers are needed to handle error conditions from the peripherals that are found in iarik files.
