Sometimes, a photo will need to be cropped. This used to be a cumbersome, manual process. After all, you have to crop the image, which means manually increasing the size of one or more of the sides of the image or repeating this process, changing the size of each side and repeating again. Changing the size manually when working in a large image, was long, tedious, and often times inaccurate. Thankfully, Adobe's new **Photoshop** \"adjust crop tool\" helps simplify this process. It helps get rid of several limitations where the new crop tool is released (including never getting cut off). Fools rush in where angels fear to tread. I didn't think there was much hope for the CC, but now they are rolling out CS6 in steps of course. My guess is that the next version of CC will most likely be called CS6.0, with the CC actually being a free add-on to CC5.5. It's kinda like buying a house with a warranty, eventually the house will burn down to the ground. Except that it's photoshop for god damn's sake. If it does burn down, at least all your work will still be there. I would say the one gripe I have with the program is that it doesn't support Apple's pro photo-management features, such as the RAW formats. This image format is not native, but Adobe has promised a conversion plug-in for it, which will likely be included in the updates until it's developed properly.
