Photoshop CS6 isn't the only version with new features; the latest and greatest *Photoshop Elements* also comes with lots of improvements. One of the most welcome new features is the ability to resize JPEG and TIFF images while using the None compression setting. I was very surprised and pleased to discover this helpful function in Elements. Previously, I was having to crop photo images - a highly time-consuming task - into smaller versions for printing. This bit of magic from Adobe makes image resizing way more user-friendly, and that's a major plus. Elements also adds the ability to apply brightness and contrast adjustments with a single button, increasing the ability to perform quick and simple image editing. I too found the adjustments quite easy to make and a welcome improvement. In fact, my only complaint about Elements' new feature is its dialog boxes. I'm not sure how this new feature will hold up in real-life situations of image editing. I have found, however, that image resizing with Elements does work fairly well. The new dialog boxes could stand a small revision. During the image editing process, particularly when I was viewing the preview of the image being edited, the dialog box often blocked the view of my object, making it a little tricky to find what I wanted to do. I have restricted my review to Photoshop and Lightroom because, at the time of this review, these are the software programs that I use on the computer I primarily use for reviewing my images. I've been using Photoshop since version 3 and followed its development closely -- although the new version is a big step forward.

With the ability to collaborate on ideas, rapidly access assets in the cloud, and weave them together in one visually stunning work, Photoshop Creative Cloud enables you to make ideas come to life quickly. Adobe has introduced a brand new dynamic Masking feature within Photoshop to avoid stocking up on filters to mask for specific areas of your image. To apply a mask to your image go to Layer > Layer Mask > Layer Mask from the menu bar. Photoshop 2018 brings the masking functionality of Adobe Illustrator to Photoshop, and is fully integrated with Photoshop Layers panel — you no longer need to separate the two programs in order to mask or composite two layers into Photoshop. Regardless of how you select your objects on a layer in Photoshop, you can now mask with simple control clicks. In previous versions of Photoshop, there were additional steps involved to get to the proper layer when you wanted to switch layers in your composition. To do so, one would select the new layer, then switch it, then close either the other layer or the masked layer. With Photoshop 2018, it is a lot simpler to switch layers, and to mask something without having to go into the masking tool, it's simply a toggle with the command or control button. Open the Layers panel, select the layer you want to switch with, right-click, and choose Mask from the menu. Check the box, and that's it. Now you can move your element freely over the masked layer, and reconnecting to the layer in the Layers panel.
