With it, a user is able to compress all their files and directories (which are inside the directories that are right-clicked) into one compressed file. A user simply right-clicks a directory and chooses "compress to tarball". The control panel will then appear for the user to select their choice of compression (algorithms). This program is primarily intended for users to backup their files on the Windows operating system. Other compression options and options to add a control panel to Explorer are also included. Keytarball can also be used to compress directories, however it is not advertised as a full backup program. Instead it is a simple way to compress and compress directories. I created this program because I felt there was a need for a program that enabled me to compress directories for a specific task and I hope others will find this program useful too. License: The license of this program is completely open and free. Limitations/Terms: This project has not been tested with older versions of Windows. Users who are still using Windows XP are likely to encounter issues. What's New in the WinTarBall?

1. Read this thread before asking questions here (as of August 2011, it is the most up-to-date WinTarBall related thread on the Internet): (For Win10 users, it is similar to the instructions found there, as in a stripped-down form)
2. Make sure you install KB2514890 or KB2517721 to get the "Compress with WinRAR" right-click option. These are optional and not always available. If it's not available, there are additional steps to install WinRAR separately.
3. Download the latest.zip archive of WinTarBall (only the latest revision will work)
4. If you're a Windows 8 user, get WinTarBall version 7 (7.0.0.70 is the newest revision as of now). If you're a Windows 8 user, get WinTarBall version 8.
5. Install WinTarBall on the entire C: drive (you can install to a different drive if you want)
6. Close and reopen Explorer
7. Right-click on any directory and choose "compress to tarball" (or

"compress to tarball and open") 8. WinTarBall creates.tgz or.tbz file archives (directories will also create.tar.gz or.tar.bz2 files if that option is chosen) 9. WinTarBall also creates a WinRAR compressor icon for each archive. I prefer to delete the.rarcompress file in each compressed directory so that I can keep a clean folder structure. I'm not sure if this is required for Windows 8 users, but I've not run into problems yet. If you don't delete the.rarcompress file in your compressed directory, WinTarBall will try to run WinRAR every time you compress a directory. 10. Create a batch script or a shell script file on your desktop or on your Start Menu, then add the following commands: C:\Users\Desktop\WinTarBall\Jahz.exe C:\TBR\WindowsTarBall.zip C:\TBR\TBR.exe 11. If WinZip is not an option (due to encryption or problems with the program) you can use 7-Zip, WinRAR or WinZip's ZIP & RAR archiver to create an archive. Compress the entire C: drive to create an archive. Then, you can use the WinRAR executable that is created by WinTarBall to extract the compressed.tgz or.tbz archive. WinTarBall Versions: When you install WinTarBall, it is not actually installed to a folder anywhere in your C: drive.
