KEYMACRO is an addin designed to provide users of Excel with the functionality to create macros quickly and easily. With Keymacro, users can easily create macros to perform actions on sheets or ranges of cells. Keymacro is built upon the excel macro recording functionality. Speed: KEYMACRO provides an extremely fast macro recorder that generates macros based on user actions. When macros are generated based on user actions, keymacro can record up to one million lines of codes in a very short time. That is more than 100 times faster than the speed of the Excel-Mutable Record macro. Unique: Keymacro supports both the "Insert Macro" feature and the "Insert User Macro" feature. Users can also create macros based on file or cell actions. With the "Insert Macro" feature, users can record

macros and save them in a file. Powerful Features: Keymacro provides a wide variety of power features including macro labels, breakpoints, active cell address, create macro from file, etc. In addition, Keymacro offers some features that are not supported by Excel-Mutable Record, such as three-column cells, named ranges, excel name/value pairs, insert user macro, etc. KEYMACRO Review: In conclusion, Keymacro is a useful addin. It is suitable for users who are looking to create macros quickly. It is helpful for users who do not have the time or skills to write macro codes, but need them to perform tasks on worksheets. Polymeric biomaterials have been the focus of research in the field of tissue engineering due to their high biocompatibility and structural similarity to the natural extracellular matrix. During

the last decade, considerable attention has been devoted to the development of nanofibrous scaffolds for bone tissue engineering. These scaffolds provide a suitable substrate to support cellular growth and promote tissue regeneration. In this review, we will focus on the advantages of using nano-structured polymers for the development of nanofibrous scaffolds. Several methods have been employed to fabricate nanofibrous polymeric scaffolds, including electrospinning, phase separation, self-assembly, and self-assembly from an emulsion template. These methods are capable of generating nanofibers of a wide range of morphologies, diameters and compositions, making them suitable for bone tissue engineering applications. Furthermore, the material properties of these nanofibrous scaffolds can be precisely tailored. There have been many reports on the utilization of polymeric nanofibrous scaffolds in bone tissue engineering applications. These scaffolds are able to support the proliferation and osteogenic differentiation of several types of stem cells, and have proven to be effective in facilitating tissue regeneration and promoting bone repair. Thus, polymeric nanofibrous scaffolds offer promise

for bone tissue engineering applications.. Sunday, November 10, 2008 A Little Bas relief Garden A garden can be a very personal thing. Often, the work involved in creating a garden can be quite labour intensive. Some people simply enjoy digging and planting and caring for their plants. Others have a more clinical approach to gardening. My approach is somewhere in the middle of the spectrum. I like a combination of both - a gardening regime, which makes it easier for me to be a busy mum at work, and a private garden, which is a very personal thing. I planted out my Japanese Maple and Koelreuteria in front of the White House yesterday. They have a wonderful presence. The
